## 1 Question 4

### 1.1 4. a)

Firstly we can say  $x^3 + 3x + 2$  is  $O(x^3)$  because there exists some  $k$  and  $C$  such that,

$$x^3 + 3x + 2 \leq C \cdot x^3$$

for every  $x \geq k$ .

(example;  $C = 6$ ,  $k = 0$ )

So,  $x^3 + 3x + 2$  is  $O(x^3)$ . And  $2x^4$  is  $O(x^3 + 3x + 2)$  if and only if  $2x^4$  is  $O(x^3)$ . We now can assume there are some constants  $k$  and  $C$  such that,

$$2x^4 \leq C \cdot x^3$$

for every  $x \geq k$ .

So,

$$C \geq 2x$$

however,  $2x$  grows monotonically for  $x > 0$ . This is a contradiction because then no constant value for  $C$  can be found for  $k > 0$ . Therefore  $2x^4$  is not  $O(x^3)$  and consequently not  $O(x^3 + 3x + 2)$ .

### 1.2 4. b)

For  $x \geq 2$ ,  $1 \leq \log x \leq x \leq x^2 \leq x^3$ .

So,

$$4x^3 + 2x^2 \cdot \log x + 1 \leq 4x^3 + 2x^2 \cdot x + x^3 = 8x^3$$

for every  $x \geq k$ .

This inequality holds using  $k = 2$  and  $C = 8$  as a pair of witnesses,

$$4x^3 + 2x^2 \cdot \log x + 1 \leq C \cdot x^3$$

for every  $x \geq k$ .

Therefore  $4x^3 + 2x^2 \cdot \log x + 1$  is  $O(x^3)$ .

### 1.3 4. c)

$3x^2 + 7x + 1$  is  $\omega(x \cdot \log x)$  if and only if  $x \cdot \log x$  is  $o(3x^2 + 7x + 1)$ , which is,

$$\lim_{x \rightarrow \infty} \frac{C \cdot x \log x}{3x^2 + 7x + 1}$$

for every  $x \geq k$ .

For  $x \geq 2$ ,  $1 \leq \log x \leq x \leq x^2$ .

So  $3x^2 + 7x + 1$  grows faster than  $x \cdot \log x$  so  $\lim_{x \rightarrow \infty} \frac{C \cdot x \log x}{3x^2 + 7x + 1}$  holds for  $k = 2$  and  $C = 1$ . Therefore,  $x \cdot \log x$  is  $o(3x^2 + 7x + 1)$ , and consequently  $3x^2 + 7x + 1$  is  $\omega(x \cdot \log x)$ .

### 1.4 4. d)

For  $x \geq 2$ ,  $\log x \leq x \leq x^2$ .

So,

$$x^2 + 4x \geq x^2 = x \cdot x \geq x \cdot \log x$$

for every  $x \geq k$ .

This inequality holds using  $k = 2$  and  $C = 1$  as a pair of witnesses,

$$x^2 + 4x \geq C \cdot x \log x$$

Therefore  $x^2 + 4x$  is  $\Omega(x \cdot \log x)$ .
